

## Programming Practice Lab

### Assignment 2

#### **CO2: Work with files in C**

1. Write a program to store student information in a file and to do the following operations. Information includes roll, name, and score in five subjects. User may like to add record (ensure roll number is unique), display all records showing roll, name and total score. User may search for the record against a roll. User may edit the details of a record. User may delete record. Deletion may be logical (by some means indicate it is an invalid record and to be avoided in processing) and physical (file will not have the record).
